Question 1

Correct

Marked out of 3.00

⚑ Flag question

Write a program to read two integer values and print true if both the numbers end with the same digit, otherwise print false. Example: If 698 and 768 are given, program should print true as they both end with 8. Sample Input 1 25 53 Sample Output 1 false Sample Input 2 27 77 Sample Output 2 true

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>
int main()
{
    int a,b;
    scanf("%d %d",&a,&b);
    if (a%10==b%10)
    printf("true");
    else
    printf("false");
    return 0;
}
```

	Input	Expected	Got	
✓	25 53	false	false	✓
✓	27 77	true	true	✓

Passed all tests! ✓

Question **2**

Correct

Marked out of 5.00

⚑ Flag question

Objective

In this challenge, we're getting started with conditional statements.

Task

Given an integer, *n*, perform the following conditional actions:

· If *n* is odd, print Weird

· If *n* is even and in the inclusive range of *2* to *5*, print *Not Weird*

· If *n* is even and in the inclusive range of *6* to *20*, print *Weird*

· If *n* is even and greater than *20*, print *Not Weird*

Complete the stub code provided in your editor to print whether or not *n* is weird.

A single line containing a positive integer, *n*.

Constraints

· $1 \leq n \leq 100$

Output Format

Print Weird if the number is weird; otherwise, print Not Weird.

Sample Input 0

3

Sample Output 0

Weird

Sample Input 1

24

Sample Output 1

Explanation

Sample Case 0: *n = 3*

n is odd and odd numbers are weird, so we print *Weird*.

Sample Case 1: *n = 24*

n > 20 and *n* is even, so it isn't weird. Thus, we print *Not Weird*.

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>
int main()
{
    int a;
    scanf("%d",&a);
    if (a%2!=0)
    printf("Weird");
    else if (a%2==0 && a>=2 && a<=5)
    printf("Not Weird");
    else if (a%2==0 && a>=6 && a<=20 )
    printf("Not Weird");
    else if(a%2==0 && a>=6 && a>20)
    printf("Not Weird");
    return 0;
}
```

✓	3	Weird	Weird	✓
✓	24	Not Weird	Not Weird	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 7.00

⚑ Flag question

Three numbers form a Pythagorean triple if the sum of squares of two numbers is equal to the square of the third. For example, 3, 5 and 4 form a Pythagorean triple, since 3*3 + 4*4 = 25 = 5*5 You are given three integers, a, b, and c. They need not be given in increasing order. If they form a Pythagorean triple, then print "yes", otherwise, print "no". Please note that the output message is in small letters. Sample Input 1 3 5 4 Sample Output 1 yes Sample Input 2 5 8 2 Sample Output 2 no

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>
int main()
{
    int a,b,c;
    scanf("%d %d %d",&a,&b,&c);
    if(a*a + b*b == c*c || b*b + c*c == a*a || c*c + a*a == b*b)
    printf("yes");
    else
    printf("no");
    return 0;
}
```

	Input	Expected	Got	
✓	3 5 4	yes	yes	✓
✓	5 8 2	no	no	✓
